

How to get the current org's domain in a flow

```
LEFT($Api.Partner_Server_URL_470, FIND( '/services',  
$Api.Partner_Server_URL_470))
```

that gives me a nice `https://customer-customization-9925.cs2.my.salesforce.com/` URL

I think you can create a formula variable in your flow and use it
