

Polymorphic Owners and field references

{!subj_LoopedAccount.Owner.Email} is the right format but it returns null

when I put it on a screen it works fine

but in my scheduled flow it doesnt

ah nm I figured it out lol {!subj_LoopedAccount.Owner.Email} is right.

BUT

{!subj_LoopedAccount.Owner:User.Email} is what you want with polymorphic owners, like Cases

☐

Non-Pasta version - if you reference a polymorphic field in a scheduled flow, you MUST specify the type of relationship you are trying to follow - assuming that only one type of relationship will exist due to a pre-existing query will not work.

Even more succinct: when following a polymorphic relationship, you should always specify which relationship type you are following.
